## ***Plant compounds may aid chemotherapy***

New Zealand's Plant & Food Research identify compounds in carrots and parsley that may support treatments

**R**esearchers at Plant & Food Research in New Zealand have identified plant compounds present in carrots and parsley that may one day support more effective delivery of chemotherapy treatments.

Scientists at the institute, working together with researchers at The University of Auckland and the National Cancer Institute of The Netherlands, have discovered specific plant compounds able to inhibit transport mechanisms in the body that select what compounds are absorbed into the

body, and eventually into cells. These same transport mechanisms are known to interfere with cancer chemotherapy treatment.

The teams' research, recently published in the European Journal of Pharmacology, showed that falcarinol type compounds such as those found in carrots and parsley may support the delivery of drug compounds which fight breast cancer by addressing the over-expression of Breast Cancer Resistance Protein (BCRP/ABCG2), a protein that leads to some malignant tissues ability to become resistant to chemotherapy.

"It's very exciting work" says Plant & Food Research senior scientist Dr Arjan Scheepens. "Our work is uncovering new means to alter how the body absorbs specific chemical and natural compounds. Ultimately we are interested in how food could be used to complement conventional treatments to potentially deliver better results for patients."
