Food fraud risks grow

Research group Ecovia has highlighted organic and eco-labelled food as being at particular risk

Smart labels and new technology can help in the fight against food fraud

The growing market for sustainable and premium foods is bringing greater risks of food fraud, according to specialist research, consulting and training company Ecovia Intelligence.

According to the group, the best way forward is greater transparency in supply chains, with new technologies and global alliances playing an important role.

"As will be shown at upcoming editions of the Sustainable Foods Summit, there are also health (food safety) and environmental impacts of food fraud," the group outlined. "According to the World Health Organisation, almost one in ten people get ill from eating contaminated food each year."

Organic and eco-labelled food products are at high risk from food fraud because they command a premium, the company said.

Ecovia Intelligence sees Asia most at risk from food fraud. Rising consumer spending power and growing demand for sustainable and premium foods has made Asia the fastest growing market for such products.

China has the largest organic products market in Asia; it is also described by Ecovia as "the epicenter of food fraud". In the last decade, food scandals have involved mislabelled organic pork, rotten meat, and sewage oil. In 2008, the adulteration of dairy products and milk powder with the industrial chemical melamine led to six baby deaths and 300,000 sick.

The recent Brazilian beef and horsemeat scandals highlighted the vulnerabilities in supply chains of food products, the group continued, and in general, the longer and more complex the supply network, the greater the risks of food fraud.

Transparency is coming to the fore, partly because consumers are keen to know about product origins, production methods, and sustainability credentials. Technology is playing an important role, with smart labels and mobile apps meeting the informational needs of consumers.

In the UK, the Soil Association has partnered with the technology firm Provenance to provide smart labels on

organic foods. QR codes, Barcodes, and NFC tags, are enabling consumers to track organic food products from farm to fork.

"Technology is already being deployed for food authenticity and to detect fraud," Ecovia explained. "Analytical tools, such as mass spectrometry and gas chromatography, are being used to authenticate premium products, such as Manuka honey, basmati rice, and extra virgin olive oil. Forensic techniques, such as DNA fingerprinting, are now making their way to food labs to check product samples."

International alliances are being formed to tackle food fraud. Announced recently, the EU-China-Safe project has European and Chinese organisations partnering to improve food safety and tackle food fraud. As well as providing safer, authentic food, the initiative aims to boost consumer confidence and facilitate food trade between the EU and China.

The Global Alliance on Food Crime is another new initiative, the group highlighted. Co-chaired by Andy

Morling, Head of National Food Crime Unit UK, the coalition of international thought leaders focuses on the prevention, detection and disruption of food crime.

"Such alliances are necessary to combat food fraud," Ecovia concluded. "A concern however is that as more fraud cases come to light, a casualty may be consumer trust in sustainable foods. In this respect, prevention

– rather than cure – maybe the best course of action for the sustainable food industry."
